

# DevOps at Scale: Simplifying Service Architectures with Spinnaker

By: Casper Kristiansson & Nicole Wijkman

# What is DevOps at Scale?

## Definition

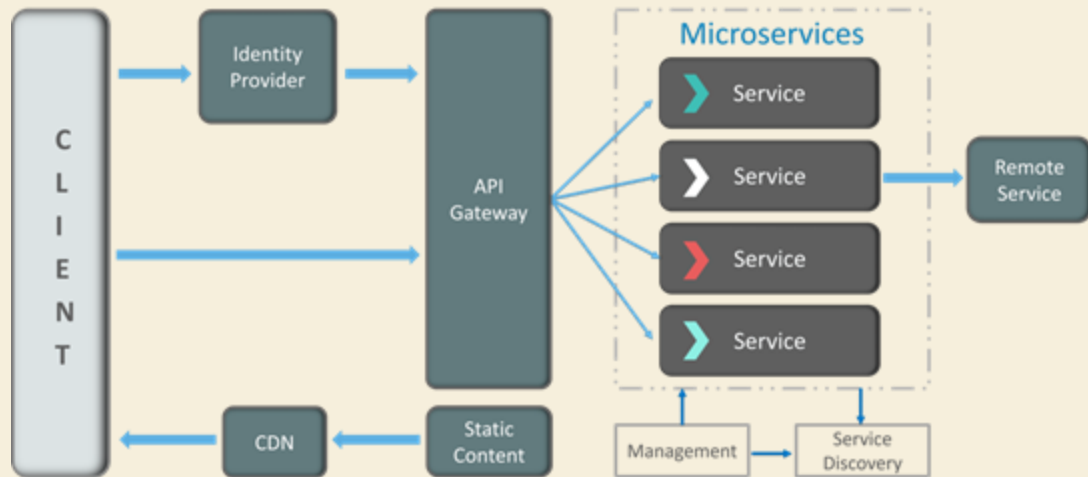

DevOps at scale manages practices for thousands of services

## Scaling Increases Complexity

More services mean more complexity in CI/CD, dependencies, deploying and managing services

## Focus

Managing services and teams: Ensuring smooth deployments and coordination across many microservices and development teams

# Challenges of Scaling DevOps

## Managing Many Services

- Updating versions
- Consistent Deployments
- Dependency Management
- Orchestrating services
- Avoiding downtime
- Failed Releases

## Coordinating Large teams

- Code Conflicts
- Longer Deployment Times
- Coordination Challenges Across Teams

# Spinnaker

## Multi-Cloud Deployments

Deploy Across AWS, GCP, Azure while ensuring consistency in microservices with centralized control for environments

## Advanced Deployment Strategies

Blue/Green and Canary deployment strategies with automated rollbacks for safe releases ensuring zero-downtime updates

## Pipeline Automation

Coordinate complex release processes with automated testing and approvals scaled for large CI/CD pipelines

# Key Features of Spinnaker

## Multi-Cloud Deployments

### Multi-Cloud Deployment

- Seamlessly deploy across AWS, GCP, Azure, Kubernetes, etc.
- Centralized control for managing cloud-specific configurations and environments.

### Consistent Multi-Environment Management

- Define once, deploy across dev, staging, and production environments in multiple clouds.
- Simplifies managing diverse environments with unified pipelines.

```
stages:
  - name: Deploy to AWS
    type: deploy
    clusters:
      - cloudProvider: aws
        account: aws-prod
        application:
microservice-1
  - name: Deploy to GCP
    type: deploy
    clusters:
      - cloudProvider: gcp
        account: gcp-prod
        application:
microservice-1
```

# Key Features of Spinnaker

## Advanced Deployment Strategies

### Blue/Green Deployment

- Deploy new versions (blue) alongside the current version (green) with zero downtime.
- Switch traffic to the new version only after it's validated, minimizing risk.

### Canary Deployment

- Gradually roll out updates to a small percentage of users before full deployment.
- Monitor performance and user feedback during canary stages to ensure stability.

```
stages:
  - name: Deploy Blue
    type: deploy
  - name: Switch to Blue
    type: manualJudgment
  - name: Rollback to Green
    type: rollback

  - name: Canary Deployment
    type: canary
    canaryAnalysis:
      metrics:
        - error_rate
        - latency
  - name: Full Deployment
    type: deploy
```

# Spinnaker Solving the Problems

## Challenges Solved

**Managing Many Services:** Automates multi-cloud deployments without any downtime

**Coordinating Large Teams:** Standardized pipelines reduce conflicts and deployment times.

## Spinnaker's Solutions

**Multi-Cloud Support:** Seamlessly deploys across AWS, GCP, etc.

**Automated Rollbacks:** Ensures safe, error-free releases.

**Advanced Strategies:** Blue/Green & Canary deployments for zero-downtime updates.

# Reflection and Q&A

## Key Takeaways

**Automated Multi-Cloud Deployments:** Spinnaker streamlines deployments across multiple clouds for multiple services, reducing complexity and manual errors

**Zero-Downtime & Safe Rollbacks:** Advanced deployment strategies like Blue/Green and Canary ensure updates without downtime and allow fast rollbacks if needed

## Questions?
